

VIRTUAL CHANGING STATION

User-friendly and hygienically safe operation in changing stations and isolators

The virtual changing station was specially developed for user-friendly and hygienically safe operation in changing stations and isolators. It automatically recognizes the cages used with the help of RFID Talkits and documents all animal and cage transactions at the same time as they are carried out. The corresponding electronic cage cards (CageTalkers) are created automatically—without any manual intermediate steps.

Hands can remain in the barrier area during the entire process. The hands and stream deck are disinfected in a continuous process so that the process does not have to be interrupted. The software is deliberately kept simple to use: Automatically recognized processes from the data, accompanied in some cases by simple dialogs, are confirmed via the stream deck without the need to navigate through tables.

Ease of use is also maintained when working in isolators. The software can be controlled via the Stream Deck directly through a transparent glove—it is no longer necessary to remove your hands. This keeps the workflow ergonomic, efficient, and safe.
